## INTRODUCTION

Federal requirements state that regions with more than 200,000 people, known as Transportation Management Areas (TMAs), must maintain a Congestion Management Process (CMP) and use it to make informed transportation planning decisions. The Federal Highway Administration (FHWA) defines a CMP as a "systematic transparent process for managing congestion that provides information on transportation system performance and on alternative strategies for alleviating congestion and enhancing mobility." The purpose of the CMP is to define congested corridors in the region, develop strategies to mitigate the congestion, and provide a way to monitor the effectiveness of the strategies. The CMP is also intended to use performance measures to direct funding toward projects and strategies that are most effective for addressing congestion. The official Federal Register regarding the CMP (Title 23, Section 450.320 and Section 500.109) is available in the Appendix. This document serves the Federal reporting requirements for the Congestion Management Process for the North Front Range Metropolitan Planning Organization (NFRMPO).

The NFRMPO completed an update to the region's Congestion Management Process which was adopted by the Planning Council in September 2010. One key change in the CMP is an increased focus on data collection to measure and monitor the transportation system's performance rather than relying heavily on the regional travel demand model for performance measures. In addition to meeting the Federal CMP reporting requirements, the NFRMPO has a desire to use this Transportation System Performance report as a mechanism to provide regional benchmarking to inform transportation investment decisions and to paint a clear picture of the region's transportation system and needs. This report serves to document the system-wide performance measures related to congestion.

## Purpose of Annual Transportation System Performance Report

This 2012 Transportation System Performance report has been structured to focus on reporting the system-wide and project-level data collection and performance measures outlined in the 2010 NFRMPO CMP. Since this is the third year of data collection, in many cases this report provides a comparison between 2010, 2011, and 2012 data. In subsequent years, the Transportation System Performance report will continue to document and analyze the trends for each of the performance measures.

As recommended in the 2010 NFRMPO CMP, in the 2010/2011 Call for Projects (for Surface Transportation Program Metropolitan (STP-Metro), Transportation Enhancement, and Congestion Mitigation and Air Quality Improvement Program (CMAQ) funding), project applicants were required to commit to completing before and after data collection. Although these data are not yet available, the project-level data and performance measures will be included in future Transportation System Performance reports.

It is important not only to document the system-wide and project-level performance measures, but also to evaluate the trends in the performance measures over time to identify and analyze the factors affecting congestion-related performance measures. This Transportation System Performance report is intended to benefit the region by:

- Providing measurements of how the region's towns, cities, and counties are doing in terms of managing congestion on an annual basis;
- Guiding project accountability by requiring before and after data collection for all projects funded through the MPO;
- Providing tools and data to inform decisions on how to spend available transportation funding;
- Providing a basis for pursuing additional transportation funding by "painting" a clear picture of the region's transportation needs; and
- Providing supporting data to the Chambers of Commerce and Economic Development Corporations responsible for "selling" the region's transportation system as beneficial for prospective businesses and future economic investment.

## Structure of Congestion Management Process

The 2035 Regional Transportation Plan (RTP) Update identifies Tier One of the Regionally Significant Corridors (RSCs) to be the focus of the Congestion Management Process in the North Front Range. Therefore the data collected for this Transportation System Performance report is heavily focused on the Tier One corridors (as defined in the 2035 Regional Transportation Plan), which include I-25, US 287, and US 34 and their parallel facilities, as shown on Figure 1.

US 34 east of I-25 looking west.

2012 NF 20 M 1 Transportation System Performance
Figure 1. Tier One Corridors

Legend

The structure of the MPO's Congestion Management Process is depicted on Figure 2. The green boxes represent elements of the CMP that establish the state of the region's congestion and what is important to the region in terms of managing or mitigating the congestion.

The beige boxes represent project-level components of the CMP; the CMP serves as both a filter and an incentive in selecting projects for the Transportation Improvement Program (TIP), and all projects that receive funding through the MPO are required to collect before and after data. Finally, the blue colored box represents the systemic component of the CMP; regional and corridor-level data are to be collected on an annual basis to compare the state of the region in terms of congestion levels on a year to year basis. Both the system monitoring and the project-level data collection are documented and analyzed in this Transportation System Performance report.

US 287 near Prospect Road in Fort Collins.

Figure 2. CMP Structure

## DATA COLLECTION

The data collected for this Transportation System Performance Report are primarily centered on the Tier One corridors since they are the focus of the CMP; however, some of the performance measures pertain to the region as a whole, in which case region-wide data have been collected. Much of the data in this report are regularly collected by the Colorado Department of Transportation (CDOT), the NFRMPO, the cities and counties, and the transit providers in the region. To supplement the available data, the MPO conducted travel time surveys in 2013, and had automobile occupancy counts recorded along the three Tier One corridors in 2011. Summaries of the data collected and used in this report are provided in the Appendix.

## Travel Time Surveys

Travel time surveys were completed for the Tier One corridors. The travel time runs were completed only for the primary facility (i.e., I-25, US 287, and US 34) and not for the parallel routes, with the exception of US 34 Business, as travel conditions on primary facilities can

A stopwatch was used to record the travel time between major intersections along each corridor. cause travel on parallel facilities to vary. The surveys were completed on Tuesdays, Wednesdays, or Thursdays during January through March 2013 by NFRMPO staff to reflect typical weekday conditions and coincide with the area's transportation model. The survey involved driving the length of each facility within the MPO boundary in each direction and recording the travel time between major intersections along the corridor, using the "floating car" methodology in which the test vehicle passes as many vehicles as pass the test vehicle. Any intersection-related delays (stopped delays) were recorded, including information about the delay length and location. The data collection included four runs in each direction for each facility during the morning and afternoon peak periods and two runs in each direction for each facility during the noon peak period. The results of the runs for each time period were then averaged to determine an average delay along each corridor during each time period. If a major traffic crash or adverse weather occurred, the travel time run was not used.

## Automobile Occupancy Counts

Automobile occupancy counts were recorded in 201 lat two locations on each of the three primary facilities of the Tier One corridors to understand the level of carpooling over time. Each travel lane was video recorded, and the number of persons per vehicle was counted. The counts were recorded during the morning, noon, and afternoon peak periods at these locations:

Video recordings of highway locations were used to count the number of passengers in each passing cars.

- I-25 south of US 34
- I-25 south of SH 14
- US 34 between US 287 and I-25
- US 34 between US 34 Business and US 85
- US 287 south of US 34
- US 287 south of SH 14

SYSTEM PERFORMANCE MEASURES
The 2010 NFRMPO CMP outlines a series of performance measures related to recurring and non-recurring congestion to be used to assess the extent of congestion, changes in levels of congestion over time, and to evaluate the effectiveness of congestion reduction and mobility enhancement strategies. The performance measures have been divided into five categories:

- Roadway
- Transportation Demand Management
- Transit
- Bicycle and Pedestrian
- Land Use

Because this is the NFRMPO's third Transportation System Performance report based on a systematic data collection and compilation effort, in many cases the performance measures in the following sections provide only three years of data. In subsequent Transportation System Performance

Access to alternative travel modes like transit and bicycling - can help to offset roadway congestion. reports, the measures will continue to be compared over time to understand trends in the transportation system.

## Roadway

The roadway-based performance measures rely heavily on the daily traffic counts that CDOT maintains in their count database.

## Traffic Volumes

The daily traffic volumes on the primary facility of the three Tier One corridors over the past decade are shown on Figure 3. From this graph, several observations can be made:

- I-25 south of US 34 carries nearly three times the volume of traffic as l-25 north of Fort Collins (south of SH 1).
- Traffic volumes on I-25 south of US 34, I-25 south of SH 1, and US 34 east of County Line Road remained the same as in 2011.
- I-25 south of SH 1 has experienced the greatest percentage increase in traffic over the past decade (about 21 percent since 2002), while US 34 east of County Line Road has experienced the second largest increase over this time period (about 15 percent).
- Traffic volumes on US 34 west of WCR 53 continued to decline, falling almost 10 percent since last year.
- Traffic volumes on US 287 south of US 34 in Loveland and south of SH 14 in Fort Collins grew compared to 2011, with an increase of 33 and 11 percent respectively. This is in contrast to the general decreasing trend of both locations over the past five years. However, counts on segments between these two locations generally decreased.

Figure 3. Historical Daily Traffic Volumes

Source: CDOT traffic volume database

## Travel Time

Travel time studies were conducted along the three primary facilities of the Tier One corridors, as described in the Data Collection section of this report, and US 34 Business. Slight changes in travel time between 2012 and 2013 varied per time period and facility. As illustrated on
Figure 4, average travel time along l-25 from SH 66 on the south end of the MPO to SH 1 on the north end of the MPO was measured to be approximately 29 minutes during all three peak periods of the day. These results show the travel times on l-25 to be consistent (and therefore predictable) during normal weekday conditions (Tuesday - Thursday).

The US 287 travel time survey results show more variability between the different periods of the day. While the average travel time from SH 66 to SH 14 on US 287 is approximately 53 minutes during the $A M$ peak period, the average travel time during the $P M$ peak period is approximately 59 minutes. This difference is very consistent from year to year.

The travel times along the US 34 corridor from Wilson Avenue in Loveland to US 85 via the US 34 Bypass also show some variability depending on time of day. While the average travel time is approximately 31 minutes during the AM peak period, the average travel time during the PM peak period is approximately 35 minutes. Travel times along US 34 Business are more consistent, with less than a minute difference between the three periods of the day.

As a part of the travel time surveys completed in early 2013, stopped delay was recorded. Stopped delay typically occurs at the approach to a signalized intersection or in severe congestion along a freeway; it represents the amount of time a driver can expect to be stopped in his vehicle while traveling the length of the corridor. As shown on Figure 5, no stopped delay was recorded on I-25. The average total stopped delay of all three time periods along US 287 was higher in the southbound direction, and the stopped delay was higher in the westbound direction US 34. US 34 Business saw a trend reversal, with eastbound traffic experiencing more stop delay than westbound traffic in the 2013 data.

Transportation System Performance
Figure 4. Average Travel Time

Source: NFRMPO trovel time surveys, 2013

Figure 5. Average Total Stopped Delay

Source: NFRMPO trovel time surveys, 2013

Using the travel time data, the actual speeds along the various segments of the three corridors (l-25, US 287, and US 34) and US 34 Business were compared to the posted speed limits. A comparison of the recorded travel speeds with the posted speeds by direction of travel during the AM peak period is provided in Figure 6. Along l-25, nearly all segments tend to be within five mph of the posted speed limit. The majority of the US 287 corridor north of Berthoud through Loveland and Fort Collins has travel speeds that are between five and 15 mph slower than the posted speed, but a segment between SH 392 and Harmony Road, and a segment in Loveland just south of US 34, have travel speeds 15 to 20 mph slower than the speed limit. Along the US 34 corridor, travel speeds west of WCR 13 are slower than last year. Speeds are generally five to 10 mph slower than the speed limit, with some segments having even lower speeds. Slower speeds are also experienced on US 34 within Greeley, with speeds varying significantly but are slowest between $65^{\text {th }}$ Avenue and $47^{\text {th }}$ Avenue $(20+$ mph slower than the posted speed limit). US 34 Business shows similar variability in travel speeds.

Figure 6. AM Peak Period Travel Speeds

Figure 7 provides a comparison of the recorded speeds during the PM peak periods with the posted speeds. In general, the same segments that experienced slowing in the AM peak period experienced slowing in the PM peak period, but had an increased level of slowing. Segments are also generally slower than compared to 2012 . Segments along $\mathrm{l}-25$ generally experience speeds within five mph of the posted speed limit, but a growing number of segments are five to 10 mph below the speed limit. Segments on US 287 north of US 34 experience varying levels of speeds below the speed limit and are generally consistent with last year. Southbound US 287 on the Berthoud Bypass now has speeds five to 10 mph below the posted speed limit. US 34 west of WCR 13 experience a significant amount of slowing, with speeds recorded 20+ mph below the speed limit on a number of segments. Similar slowing was observed within Greeley and is a modest reduction in speed compared to last year.

Figure 7. PM Peak Period Travel Speeds

## Levels of Service

A system wide measure which is a good indicator of the impacts of growth on transportation is level of service (LOS). This LOS analysis is based on the most current daily traffic counts (2012 for all state highways and between 2005-2012 for non-state highways) and does not explicitly account for intersection operations or peak period delays. However, it does provide a straightforward means of comparing the daily volumes on various segments of the Tier One corridors to the capacities of those facilities, and will serve as a comparison of the daily LOS over time. Table 1 documents the LOS standards set by each MPO municipality.

## What is Level of Service?

Level of service (LOS) is a qualitative measure which describes operating conditions, or traffic flow rates. LOS A represents a free flow condition, and LOS F represents a breakdown of traffic flow with excessive congestion and delay. Existing daily levels of service have been calculated on all Tier One corridors based on the daily traffic volumes divided by the planning level roadway capacities (V/C). Congestion, as defined in the Congestion Management Process, is LOS E (V/C is between 0.9 and 1.0 ) or LOS F (V/C is 1.0 or greater), with E nearing capacity and F over capacity.

Table 1. Level of Service Standards by MPO Municipality

| Entity | LOS C | LOS D | LOS E | Not Specified |
| :--- | :---: | :---: | :---: | :---: |
| Berthoud | $\bullet$ |  |  |  |
| Eaton |  |  |  | • |
| Evans |  | $\bullet$ |  |  |
| Fort Collins |  | $\bullet$ | $\bullet$ |  |
| Garden City |  |  |  | • |
| Greeley | $\bullet$ |  |  |  |
| Johnstown |  | $\bullet$ |  |  |
| Larimer County | $\bullet^{2}$ | $\bullet^{2}$ |  |  |
| LaSalle |  | $\bullet^{3}$ |  |  |
| Loveland | $\bullet^{3}$ | $\bullet^{3}$ |  |  |
| Milliken | $\bullet^{4}$ | $\bullet^{4}$ |  |  |
| Severance |  |  |  |  |
| Timnath |  |  | $\bullet$ |  |
| Weld County | • |  |  |  |
| Windsor | $\bullet$ |  |  |  |

${ }^{1}$ Fort Collins uses LOS D or LOS E depending on the arterial or corridor.
${ }^{2}$ Larimer County uses LOS C for rural areas and LOS D for urban areas.
${ }^{3}$ Loveland uses LOS D for State Highways and LOS C for all other city arterials.
${ }^{4}$ Severance uses LOS C as the standard for unsignalized intersections and LOS D for sianalized intersections.

The LOS ranges on the l-25, US 287, and US 34 corridors are depicted on Figures 8, 9, and 10, respectively. For the I-25 corridor, the LOS of the western parallel route improved slightly over 2011 between Harmony Road and Prospect Road. The southern parallel route to the US 34 corridor experienced an LOS F between US 287 and LCR 9, a decrease in performance compared to 2011. The segment of US 287 between $37^{\text {th }}$ Street and $57^{\text {th }}$ Street improved due to lower daily volumes, which is in contrast to the two count locations along US 287 documented in Figure 3. Daily volumes around those two locations (south of US 34 and south of SH 14) increased, while daily volumes in between ( $37^{\text {th }}$ Street to Mulberry Street) generally decreased. Enough estimated capacity exists to maintain an acceptable LOS along many of the segments that saw an increase in daily volumes.

Figure 8. I-25 Corridor Levels of Service, Based on Daily Volumes

Source: CDOT traffic volume database (2012), planning level capacities

Figure 9. US 287 Corridor Levels of Service, Based on Daily Volumes

Source: CDOT traffic volume database (2012), planning level capacities

Figure 10. US 34 Corridor Levels of Service, Based on Daily Volumes

Source: CDOT traffic volume database (2012), planning level capacities

## Daily vs. Peak Hour <br> Level of Service

Daily level of service (LOS) provides a rating for a road segment based on how much of its capacity is being used daily (volume over capacity, or V/C). Peak hour LOS provides a rating for intersections based on how much delay drivers experience during the peak hour.

## Lane Miles of Congestion

The number of congested roadway lane miles (LOS E or F) on a daily basis for each of the three Tier One corridors is shown on Figure 11 for 2010 to 2012. The congested lane miles correspond to the yellow (LOS E) and red (LOS F) segments depicted on Figures 8 through 10.

The lane miles of congestion are based on daily traffic volumes and planning-level capacities and do not explicitly account for intersection operations or peak period delays. The measure provides a straightforward means of comparing
 the congestion along the corridors (and over time) at a planning level. The $\mathrm{I}-25$ corridor experienced no lane miles of congestion and the US 287 corridor experienced a second year of decrease in lane miles of congestion, each due to their previously mentioned improvements in LOS. US 34 experienced congestion for the first time due to a reduction in LOS on its southern parallel facility from US 287 to LCR 9.

Figure 11. Lane Miles of Congestion (LOS E or F)

Source: CDOT traffic volume database (2012), planning level capacities *No segments of the US 34 corridor had an LOS of E or F in 2010 or 2011, and the I-25 corridor had no segments with an LOS of E or F in 2012, resulting in no lane miles of congestion on these corridors.

## Number of Crashes

The number of crashes is a surrogate measure for non－recurring congestion；crashes along a corridor result in unexpected delays and unreliable travel times．Crash data for the Tier One corridors，including the parallel facilities，were obtained from CDOT＇s crash database．Crash data for state highways was available through 2012，but CDOT＇s data post processing for off－ highway system crashes typically lags three to four years behind the state highway system crash database．In 2012，CDOT decided to process both state highway and off－highway system crash data．Because of this change，a gap in available off－highway system data exists from 2008 to 2011.

Figures 12，13，and 14 show the annual number of crashes（as a surrogate for frequency of non－recurring congestion）on the $\mathrm{I}-25$ ，US 287 ，and US 34 corridors，respectively for the time period from 2002 through 2011．The three graphs each use the same scale on the vertical axis to provide a visual comparison between the three corridors．

Crashes on I－25 within the MPO boundary in 2012 have decreased for the first time since 2008， departing from the trend of increasing crashes that occurred from 2008 to 2011．From 2002 to 2007，parallel facilities experienced a rate increase of 45 percent．No data is currently available for these facilities from 2008 to 2011 ，but 2012 appears to continue the previous trend，setting a new high for crashes during the analysis timeframe．

Figure 12．I－25 Corridor Crashes

Source：CDOT crash database

The number of crashes on US 287 has generally decreased since 2002, but increased in 2012. The number of crashes on the parallel facilities (LCR 17 and LCR 19) has decreased steadily from 2002 to 2007, with approximately 30 percent fewer crashes in 2007 compared to 2002. No data is currently available for these facilities from 2008 to 2011 , but 2012 appears to continue the previous trend, setting a new low for crashes during the analysis timeframe.

Figure 13. US 287 Corridor Crashes

Source: CDOT crash database
The number of crashes on US 34 and its parallel facilities have been relatively consistent from year to year over the analysis timeframe. In 2012, US 34 and other state highways (US 34 Business and SH 402) experienced over 800 crashes in a year for the first time since 2007, continuing the slow increasing trend since 2009. Non-state facilities (O Street and WCR 54) have experienced a decrease in crashes of over 20 percent between 2002 and 2007. No data is currently available for these facilities from 2008 to 2011, but 2012 was near the levels of previously available years.

Figure 14. US 34 Corridor Crashes

Source: CDOT crash database

## Transportation Demand Management

Transportation Demand Management (TDM) includes actions that improve the efficiency of the transportation system by altering the demand (e.g., traveler behavior) rather than increasing the supply (e.g., roadway capacity). The NFRMPO, the MPO's member governments, and employers based in the region offer various TDM programs aimed at reducing single occupancy vehicle trips, encouraging off-peak travel, and reducing trip time or length. Ultimately, TDM programs can reduce congestion on the transportation system. Future CMP Annual Transportation System Performance Reports will include TDM Employer survey results.

## Ridesharing

As described in the Data Collection section, automobile occupancy counts were recorded at two locations along the three primary facilities of the Tier One corridors in 2011. The average number of persons per vehicle at each location is shown in Figure 15. These numbers represent an average occupancy during the AM, noon, and PM peak periods. At the count locations on $\mathrm{I}-25$, nearly 88 percent of the vehicles were single occupancy vehicles (SOV), with 12 percent of the vehicles having one or more passengers. The SOV rate was approximately 84 percent at the US 287 count locations and 85 percent at the US 34 count locations.

Vehicles parked at the park-and-ride lot at I-25 and SH 402 in Loveland.

The 2010 Front Range Travel Counts: NFRMPO Household Survey reports a region-wide ratio of SOV to shared ride trips (by automobile) to be approximately 3:1 for all trips. This ratio indicates a higher rate of ridesharing than the occupancy counts on the Tier One corridors, likely because people tend to travel together (i.e., share a ride) at a higher rate during off-peak times for non-commuting trip purposes.

Figure 15. Average Auto Occupancy during Peak Periods

Source: Automobile Occupancy Counts, 2011

Figure 16 shows the automobile occupancy count results by time of day. As would be expected, the noon peak has a higher occupancy rate than the AM and PM peak periods due to a greater number of non-home based work trips such as work groups carpooling to lunch destinations.

Figure 16. Average Auto Occupancy by Time of Day

Source: Automobile Occupancy Counts, 2011

## Vanpool Ridership

One of the NFRMPO's TDM programs is the VanGo ${ }^{\text {TM }}$ vanpooling program, which includes vans that travel to various destinations within the region and between the NFRMPO and Denver region. At the end of 2012, there were 430 riders participating in the VanGo ${ }^{\text {TM }}$ program, resulting in an estimated savings of over a million vehiclemiles of travel per month. As shown on Figure 17, the l-25 corridor carries the highest number of VanGo ${ }^{\text {TM }}$ vans. The number of vans in the program has fluctuated since 2007, with a current fleet of 78 vans.

Figure 17. VanGo ${ }^{\text {TM }}$ Routes

Source: NFRMPO VanGo ${ }^{\text {TM }}$ program

## SmartTrips ${ }^{\text {TM }}$

SmartTrips ${ }^{\text {TM }}$ is a web-based tool developed and managed by the NFRMPO to help travelers find alternatives to driving alone. The service provides users with incentives and necessary tools to develop their trips via bike, transit, carpool, vanpool (VanGo ${ }^{\text {TM }}$ ), and/or walking. Usage statistics and benefits of SmartTrips ${ }^{\text {TM }}$ are shown in Table 2, and the increase in users from 2010 to 2012 is available in Figure 18.

Table 2. 2012 SmartTrips ${ }^{\text {TM }}$ Statistics

| Element | Measurement |
| :--- | :---: |
| Average commute distance | 23.7 miles |
| Carbon dioxide reduction | 93,998 lbs. |
| Total number of commutes logged | 4,207 |
| Total miles saved | 99,852 |
| Total user savings | $\$ 20,969$ |

Figure 18. Growth in SmartTrips ${ }^{\text {TM }}$ Users

Source: NFRMPO SmartTrip ${ }^{\text {TM }}$ website

## Transit

There are currently three transit providers that operate publiclyfunded, fixed-route service in the NFR region. Transfort, the largest of the three transit providers, is operated by the City of Fort Collins. Greeley-Evans Transit (GET) is operated by the City of Greeley, and City of Loveland Transit (COLT) is operated by Loveland's Public Works Department. Additionally, there are two demand-responsive services in the region: Berthoud Area Transportation Services (BATS) and Senior Alternatives in Transportation (SAINT).

## Transit Ridership

The number of passengers on a transit system over the course of a year is a common performance measure used to assess the productivity of a transit service. The annual ridership over the past four years for the three fixed-route transit providers and the two demand responsive services in the region is provided on Figure 19. Between 2007 and 2009, the three fixed-route systems each experienced a steady growth in ridership. The GET and COLT systems both have experienced a slow decline in ridership since, but both providers once again saw growth in 2012. The Transfort ridership includes FLEX, a regional bus service between Fort Collins and Longmont operated by Transfort. Initialized in 2010, FLEX experienced a 10 percent increase in ridership compared to 2011, while all Transfort ridership has increase 27 percent since 2007. BATS has generally maintained ridership in the range of 12,000-14,000 per year, but dipped below 10,000 in 2012. SAINT generally serves 20,000 - 21,000 riders per year, but recorded a record high ridership of 25,000 in 2012.

## Access to Transit

A quarter of a mile is the typical distance a person is willing to walk to get to transit service. Using the NFRMPO's base year 2009 travel demand model land use data, it is estimated that 51 percent of the MPO's population and 64 percent of the MPO's jobs are within a quarter mile of the region's three fixed-route transit services (including the FLEX regional route operated by Transfort). Figure $\mathbf{2 0}$ provides the transit availability by community, with the coverage representing the percent of households within $1 / 4$ mile of transit service. Percentages decreased due to the use of updated municipal boundaries from 2012, with Greeley-Evans Transit having the highest coverage with 75\%, followed by Loveland and Fort Collins with 64\% and 60\%, respectively.

Figure 20. Access to Transit by Community

## Transit Availability

(percentage of households within $1 / 4 \mathrm{mi}$. of transit service

Source: Transfort, GET, COLT, 2009 Household Data from NFRMPO Travel Demand Model

Likewise, twelve percent of the MPO's population is within a three mile radius of the region's park and rides, all of which are located along the l-25 corridor. Three miles is the typical catchment area for park and ride facilities. Although these park and ride facilities are currently used only for carpooling, stops for regional transit service are planned for the future.

## Bicycle and Pedestrian

## Bicycle and Pedestrian Facilities

The availability of bicycle and pedestrian facilities provides an indication of the extent to which travelers are encouraged to choose an alternative mode of travel within the Tier One Corridors. Bicycle facilities maps from each of the member agencies were overlaid on the Tier One corridor maps, and the miles of bicycle facilities within $1 / 4$ mile of the Tier One corridors (including parallel roadway facilities) as of 2013 are shown in Figure 21. Bicycle facilities include multi-use paths, bike lanes, and designated bike routes. Existing bicycle facilities mapping has recently been updated as part of the NFR Regional Bike Plan. Region-wide data on pedestrian facilities are not available at this time.

A pedestrian crossing US 287 in Fort Collins.

Figure 21. Miles of Bicycle Facilities within $1 / 4$ Mile Buffer of Tier One Corridors

Source: NFRMPO Bicycle Facilities GIS database

## Bicycle and Pedestrian Volumes

CDOT has recently initiated a statewide bicycle and pedestrian count program, in which the NFRMPO will participate. The locations of the bicycle and pedestrian counts in the region are to be determined, and count data will be summarized in subsequent CMP Annual Transportation System Performance Reports. The only count location received from CDOT was in Greeley along the Poudre Trail. Hourly counts were taken from October 18 ${ }^{\text {th }}, 2012$ through November $15^{\text {th }}, 2012$. The average daily bicycle volume at this location was 98 bicycles, with a maximum of 264 bicycles and a minimum of 6 bicycles.

The NFRMPO Regional Bike Plan in 2012 also seeks to provide more bicycle count locations. Table 3 lists bicycle and pedestrian volumes from the City of Fort Collins acquired during May, July, and September of 2012 for ten different locations.

Table 3. 2012 Fort Collins Bicycle and Pedestrian Volumes

| Location | Maximum <br> 2-Hour Count | Average <br> 2-Hour Count | Estimaied <br> Average <br> Annual Volume |
| :--- | :---: | :---: | :---: |
| Poudre Trail at Taft Hill Parking Lot | 163 | 88 | 271,000 |
| Poudre Trail at Lee Martinez Park | 321 | 171 | 474,000 |
| Poudre Trail at Timberline | 98 | 66 | 203,000 |
| Spring Creek Trail at Drake | 275 | 158 | 477,000 |
| Spring Creek Trail at Lilac Park | 193 | 148 | 472,000 |
| Spring Creek Trail at Creekside Park | 274 | 199 | 650,000 |
| Spring Creek Trail at Edora Park | 209 | 160 | 515,000 |
| Fossil Creek Trail at Spring Canyon Park | 159 | 91 | 264,000 |
| Mason Trail at Horsetooth | 148 | 81 | 240,000 |
| Power Trail at Horsetooth | 162 | 93 | 296,000 |

## Connectivity Index

A connectivity index, which involves dividing the number of links for an area by the number of intersections, helps quantify how well a roadway network connects destinations. A higher index means that travelers have increased route choice, allowing more direct connections for access between any two locations. This measure is an indicator of the walkability of a community as well as the land use pattern. Table 4 lists each MPO member municipality with their connectivity index score and rank.

Table 4. 2012 Connectivity Index Ranking

| Location | Connectivity Index Score | Rank |
| :--- | :---: | :---: |
| Garden City | 2.111 | 1 |
| Windsor | 1.953 | 2 |
| Timnath | 1.947 | 3 |
| Milliken | 1.931 | 4 |
| Severance | 1.922 | 5 |
| Berthoud | 1.898 | 6 |
| Eaton | 1.863 | 7 |
| Fort Collins | 1.836 | 8 |
| Johnstown | 1.829 | 9 |
| Greeley | 1.820 | 10 |
| Evans | 1.812 | 11 |
| La Salle | 1.807 | 12 |
| Loveland | 1.794 | 13 |

## Freight

CDOT recently produced the Commodities Transported by Region: Larimer and Weld Counties for North Front Range MPO report as part of its ongoing process of documenting freight by regions in Colorado. Table 5 lists the top exported commodities originating from Larimer and Weld Counties in 2010 by weight and by value.

The commodities originating from the area are transported out by truck, rail, and other modes. In 2010, trucking transported 99.9 percent of all commodities by both weight and value. Rail and other modes accounted for the remaining 0.1 percent.

The report also documents the top commodities transported within Larimer and Weld Counties in 2010, which is documented in Table 6. The overall percentage of commodities that both originate and terminate within Larimer and Weld Counties in 2010 by weight was 32.4 percent and by value was 4.5 percent.

Figure 22 maps the average annual daily truck traffic on highways within the MPO.
Table 5. Top Exported Commodities From Larimer and Weld Counties

| Commodity | Amount | \% of Total | Rank |
| :---: | :---: | :---: | :---: |
| By Weight (Tons) in 2010 |  |  |  |
| Gravel or Sand | 3,728,666 | 21.0\% | 1 |

## Land Use

Land use patterns and densities play a significant role in the demands on the transportation system. For this Transportation System Performance Report, two performance measures are used to measure (and compare over time) the efficiency of the region's land use as is relates to the demand for travel.

## Jobs/Housing Balance

The availability of different land uses within a community or subarea can affect the way people travel. A balance of jobs and housing reduces the need for long distance (out of town or out of region) travel and ultimately can contribute to reduced levels of congestion. A general target standard for a jobs/housing ratio is 1.5 , which implies a balance based on an average number of workers per household of approximately 1.5. (Source: Jobs Housing Balance, APA Planning Advisory Service Report Number 516, November 2003)

Figure 23 displays the ratio of jobs to households for each of the 13 municipalities in the NFRMPO; the rural category represents those areas which are unincorporated. The employment and household data are from the 2009 base year model and 2012 municipal boundaries. Region-wide, the jobs/housing ratio is estimated to be 1.33. The three major cities (Fort Collins, Greeley and Loveland) have higher average jobs/housing ratios, which are generally in line with the target standard of 1.5 . Most of the smaller communities have significantly fewer job opportunities in comparison to the number of households. There are two notable exceptions shown in Figure 22: Timnath and Garden City both have jobs/housing ratios which are higher than the region-wide average. Timnath's over 4:1 ratio is a result of the recent substantial commercial development near I-25 and Harmony Road. Region-wide, the average distance for work-related trips is 8.5 miles (source: 2010 Front Range Travel Counts: NFRMPO Household Survey).

Figure 23. Jobs/Housing Ratios

Source: NFRMPO travel demand model, base year 2009

## VMT per Capita

On average, a person living in the NFRMPO travels nearly 4.8 miles on the $\mathrm{I}-25$ corridor, 2.4 miles on the US 287 corridor, and 2.8 miles on the US 34 corridor on a daily basis. These numbers, as shown on Figure 24, are calculated by dividing the total vehicle-miles of travel (VMT) on each Tier One corridor (including the parallel facilities) by the region's 2009
population. Vehicle-miles of travel per capita in 2012 remained almost the same as in 2011 for each corridor. The l-25 corridor experienced a slight increase, while the US 287 and US 34 corridors each experienced a slight decrease.

Figure 24. Average Daily Vehicle-Miles Traveled per Capita

## PROGRAMMED AND IMPLEMENTED PROJECTS

## CMP Role in Project Selection

The NFRMPO's CMP serves an important role in the selection of projects for the Transportation Improvement Program (TIP). Federal regulations specify that all reasonable congestion management strategies must be evaluated and deemed ineffective or infeasible prior to considering a roadway capacity increase as a congestion management approach. Since the MPO's CMP is focused on the Tier One corridors, this requirement only applies to projects on the I-25, US 287, and US 34 corridors.

In support of the CMP, all projects (regardless of the corridor Tier) vying for federal or state funding through the NFRMPO must:

- Identify the primary objective(s) of the project
- Identify performance measures to assess how well the project meets its intended objective(s)
- Commit to before and after data collection in support of the stated performance measures.
These requirements were implemented in the FY12-17 call for projects. No data are currently available for the projects selected for funding, as data are not received until projects have been completed. In future Transportation System Performance reports, the project-level data collection and performance measures will be documented in this section.

## Programmed Projects

The projects listed in Table 7 have been selected by the NFRMPO Planning Council for FY1 2-17 funding. All projects listed have met CMP conformity based on the requirements documented in the 2010 NFRMPO Congestion Management Process. The parameters of the CMP as approved by the NFRMPO Planning Council are outlined in the 2035 Regional Transportation Plan Update.

## Implemented Projects

Two important transportation improvement projects which affect the transportation system's performance were implemented within the NFRMPO in 2012.

- FLEX transit service expanded
- Transfort CNG Buses (Fort Collins)

Table 8 provides project information and performance measures for these projects.

Table 7. Programmed Projects for FY12-17

[^0]
## EXTERNAL INFLUENCES

There are many factors that affect the way people travel in the North Front Range region. The following sections present historical trends in several factors that affect travel behavior and the ability of the region to address congestion. The NFRMPO has no influence over these external influences.

## Gas Prices

The cost of travel plays a significant role in the behavior of the traveling public. When gas prices rise, people are much more willing to use alternative transportation modes such as transit, carpooling/vanpooling or bicycling/walking. Average gas prices in Colorado over the last four years are presented in Figure 25.

Figure 25. 4-Year Historical Gas Prices in Colorado

Source: GasBuddy.com

## Population and Unemployment Rate

The population in Larimer and Weld Counties has steadily increased since 2001. Larimer County has experienced a 17 percent increase, while Weld County's population has increased by 34 percent. The Larimer County and Weld County population totals (including portions of the counties outside of the NFRMPO) over the last decade are presented in Figure 26. The annual population growth rate for Larimer County has been consistently between 1-2 percent since 2002, increasing a half of percent in 2012 over 2011. Weld County's annual growth rate has generally been decreasing since 2005.

Figure 26. Population Growth

Source: Colorado State Demographer
The unemployment rate in Colorado has more than doubled in the last five years. The unemployment rate in early 2008 was in the range of four percent; after the decline in the economy in late 2008, the unemployment rate quickly climbed to the eight and a half to nine percent range for most of 2009 and all of 2010. Starting in 2011, the unemployment rate has slowly been decreasing, with a sharper decrease occurring at the end of 2012. The unemployment rate as of January 2013 was 7.3 percent. Unemployment rates in Colorado over the last five years are presented in Figure 27.

Figure 27. Colorado Unemployment Rates (2008 - January 2013)

Source: Bureau of Labor Statistics

## Transportation Funding and Gas Tax

The lack of adequate funding to address transportation needs is a concern not only in the NFRMPO, but throughout Colorado and the rest of the country. CDOT's total annual revenues over the time period from 2000 through 2013 are shown on Figure 28. According to the Colorado Department of Transportation Budget for Fiscal Year 2012-2013, the state of Colorado relies heavily on the motor fuel tax as the main source of transportation related revenue. In addition to the motor fuel tax, CDOT funding sources include motor vehicle registrations and other fees, the Funding Advancement for Surface Transportation and Economic Recovery (FASTER), the Colorado General Assembly General Fund, Gaming Funds, and Capital Construction Funds. In general, the CDOT Budget concludes that "transportation revenues have in the past decade demonstrated significant volatility due to fluctuations in receipt from these various revenue sources," and "have not kept pace with inflationary increases experienced by the construction sector of the economy which have averaged about 6\% per year over the past decade."

Figure 28. CDOT Annual Revenue

Source: CDOT Budget Allocation Summaries, 2000-2011, CDOT Budget for Fiscal Year 2011-12 and for 2012-13

The motor fuel tax is a significant portion of the statewide transportation budget, see Figure 29, representing approximately 40-50 percent of the overall budget. The motor fuel tax is a fixed per-gallon excise tax, meaning that the revenue collected depends on the number of gallons sold not on the sales price. The motor fuel tax does not include any factor which reflects inflation and therefore the gas tax has remained constant since the early 1990's when the gas tax was last increased. The chart depicted on Figure 30 shows that in Colorado, motor fuel taxes collected in 2008 were worth 33 percent less than in 1988, when accounting for inflation. Motor fuel taxes collected have sharply increased since 201 1, with FY2013 expected to be at the highest level during the reporting period of 2000-current.

Figure 29. CDOT Highway Users Tax Fund Revenue

Source: CDOT Budget Allocation Summaries, 2000-2011, CDOT Budget for Fiscal Year 2011-12
Figure 30. Percent Change in State Motor Fuel Taxes on Gasoline

Source: Gas tax rates down in most states over time, Remapping Debate, November 10, 2010 http://www.remappingdebate.org/map-data-tool/gas-tax-rates-down-most-states-over-time

Additionally, despite past increases in vehicle miles traveled, the increasing fuel efficiency of motor vehicles and alternatively fueled vehicles have led to an overall decline in the rate of growth of motor fuel tax collections. The recent spike in fuel prices has resulted in a national trend of decreased vehicle miles traveled and a trend for consumers to purchase even more fuel efficient vehicles. As a result, the motor fuel excise tax has become an even less reliable source for sustained transportation funding than in the past, despite its continued importance as a source of funding for CDOT and an increase in fuel tax revenues over the past few years.

Figure 31 provides a summary of the federal and state funding (including Regional Priorities Program, STP-Metro, CMAQ, Transportation Alternatives Program) that has been distributed to the NFRMPO member governments for transportation improvement projects through the MPO. The large spike in FYO7 was a result of Regional Priorities Program funding for the US 34 Business project through Greeley.

Figure 31. Federal and State Funding Distributed through NFRMPO to Member Governments

Transit Route \& RTD park-N-Ride Analysis

Bicycle Routes \& Trails Analysis

transportation planning process. This section continues to allow NEPA studies to be initiated, even during the Alternative Analysis/corridor study process.

Another concern was that this section permits the elimination of alternatives but does not provide for the selection of a preferred alternative. Additionally, a subsequent comment indicated that this section does not require the consideration of all reasonable alternatives. As is permitted by the Council on Environmental Quality's regulations, a project sponsor can select a preferred alternative at any time in the project development process but the overall environmental analysis cannot be slanted to support the preferred alternative nor does the identification of a preferred alternative eliminate the requirement to study all reasonable alternatives as part of the environmental analysis. The FHWA and the FTA believe that the rule allows for State DOTs, MPOs and public transportation operators who choose to use planning studies as part of the overall project development process to eliminate alternatives as well as select preferred alternatives, as appropriate. Therefore, no change was made to the rule.
These comments also pointed out that the FTA requires alternatives analysis for New Starts project, but no comparable requirement is specified for highway projects. Unlike FTA's formula funded programs, New Starts has a competition based eligibility requirement and, as such, the FTA requires a level of evaluation and analysis to screen the potential myriad requests they receive for limited funds. Traditionally, applicants select proposed highway projects as part of FHWA's formula funded programs. When Congress authorizes a competition-based highway program similar to New Starts, the FHWA has established criteria to evaluate and select projects that are eligible for those funds.
It was also noted that $\S 450.322$ (Development and content of the metropolitan transportation plan) requires (in nonattainment and maintenance areas) design concept and scope be identified for projects. This comment raises several issues relative to actual application of the transportation planning process more than the regulation itself. For transportation demand modeling purposes and to meet the requirements of this part, the MPO and/or State DOT uses basic tools (e.g. engineering, capacity, past history, etc.) to identify the design concept and scope of a project, without conducting a formal corridor study. These early
decisions are generally made on a broad corridor basis and will be refined as the project advances towards implementation. The commenter appears to favor this section of the rule being mandatory rather than permissive in an attempt to further the state of the practice of planning. Encouragement and incentives for good transportation planning were proffered by the commenter as tools to be used to increase the desirability of conducting corridor studies. The FHWA and the FTA believe Appendix A provides this encouragement and incentives for good transportation planning in identifying ways to utilize planning corridor studies and thereby reduce the amount of repetitive work in the NEPA process. We appreciate the support for the concepts in this section, but, based on all the comments received, find that it is most appropriate for this section to remain voluntary and permissive.

## Section 450.320 Congestion Management Process in Transportation Management Areas

The docket included more than 25 documents that contained almost 30 comments on this section with about one-third from State DOTs, one-fifth from national and regional advocacy organizations, half from MPOs and COGs, and the rest from transit operators.

On May 16, 2006, the U.S. Secretary of Transportation announced a national initiative to address congestion related to highway, freight and aviation. ${ }^{13}$ The intent of the "National Strategy to Reduce Congestion on America's Transportation Network" is to provide a blueprint for Federal, State and local officials to tackle congestion. USDOT encourages the States and MPO(s) to seek Urban Partnership Agreements with a handful of communities willing to demonstrate new congestion relief strategies and encourages states to pass legislation giving the private sector a broader opportunity to invest in transportation. It calls for more widespread deployment of new operational technologies and practices that end traffic tie-ups, designates new interstate "corridors of the future,"

[^1]targets port and border congestion, and expands aviation capacity.
U.S. DOT encourages State DOTs and MPOs to consider and implement strategies, specifically related to highway and transit operations and expansion, freight, transportation pricing, other vehicle-based charges techniques, congestion pricing, electronic toll collection, quick crash removal, etc. The mechanism that the State DOTs and MPOs employ to explore these strategies is within their discretion. The USDOT will focus its resources, funding, staff and technology to cut traffic jams and relieve freight bottlenecks.
A few commenters reiterated that the congestion management process (CMP) should result in multimodal system performance measures and strategies. The FHWA and the FTA note that existing language reflects the multimodal nature of the CMP. Existing language (§450.320(a)(2)) specifically allows for the appropriate performance measures for the CMP to be determined cooperatively by the State(s), affected MPO(s), and local officials in consultation with the operators of major modes of transportation in the coverage area.
Most of the comments pointed out that the provisions of $\S 450.320$ (e) pertaining to projects that add significant new carrying capacity for Single Occupant Vehicles (SOVs) applies in "Carbon Monoxide (CO) and Ozone Nonattainment TMAs," but does not apply to TMAs in air quality maintenance areas. The FHWA and the FTA agree and have clarified the language in paragraph (e). We also clarified that this provision applies to projects "to be advanced with Federal funds."
Several commenters asked for a clarification regarding what CMP requirements apply in air quality maintenance and attainment areas, as opposed to the requirements in air quality nonattainment areas. The CMP requirements for all TMA areas (attainment, maintenance and nonattainment) are identified in § 450.320(a), §450.320(b), §450.320(c), and §450.320(f). Additional CMP requirements that apply only to nonattainment TMA areas (for ozone and carbon monoxide) are identified in § 450.320 (d) and § 450.320 (e).

Another commenter asked for clarification regarding the exact requirements for a CMP and how the CMP is integrated with the metropolitan transportation plan. As noted above, the specific CMP requirements for all TMAs, regardless of air quality status, are identified in this section. The CMP
in this section is not described as, nor intended to be, a stand-alone process, but an integral element of the transportation planning process. To reinforce the integration of the CMP and the metropolitan transportation plan, §450.322(f)(4) requires that the metropolitan transportation plan shall include "consideration of the results of the congestion management process in TMAs that meet the requirements of this subpart, including the identification of SOV projects that result from a congestion management process in TMAs that are nonattainment for carbon monoxide or ozone."

One commenter asked for examples of the reasonable travel demand reduction and operational management strategies as required in $\S 450.320$ (e). Examples of such strategies include, but are not limited to: Transportation demand management measures such as car and vanpooling, flexible work hours compressed work weeks and telecommuting; Roadway system operational improvements, such as improved traffic signal coordination, pavement markings and intersection improvements, and incident management programs; Public transit system capital and operational improvements; Access management program; New or improved sidewalks and designated bicycle lanes; and Land use policies/regulations to encourage more efficient patterns of commercial or residential development in defined growth areas.

## Section 450.322 Development and Content of the Metropolitan Transportation Plan

There were over 160 separate comments on this section, mostly from MPOs and COGs, followed by national and regional advocacy organizations and State DOTs. A number of comments also came from public transportation providers with the remainder coming from local government agencies, the general public or other sources.

Several MPOs and COGs and national and regional advocacy organizations that commented on this section asked for clarification regarding the 20-year planning horizon in paragraph (a). The FHWA and the FTA want to provide MPOs flexibility on how to treat the metropolitan transportation plan at the time of a revision. The actual effective date of a metropolitan transportation plan update may be dependent upon several factors, including the intent of the MPO, the magnitude of the metropolitan transportation plan revision and whether conformity needs to be determined. To specifically indicate in the final rule when a
"revision" may be considered a full "update" could result in limiting flexibility. For more information on this topic, refer to the "Definitions" section of this rule.

A small number of MPOs and COGs and national and regional advocacy organizations that commented on this section asked for clarification in paragraph (b) between long-range and short-range strategies. The FHWA and the FTA carried forward the language regarding short and long-range strategies from the October 1993 planning rule. Generally, long-range are those strategies and actions expected to be implemented beyond 10 years.

A small number of national and regional advocacy organizations also commented that the transportation demand referenced in paragraph (b) should be balanced with the environment and other factors. The FHWA and the FTA find that the balance with environmental concerns is adequately raised in other parts of the rule both in this section and in §450.306 (Scope of the metropolitan transportation planning process).

A small number of MPOs that commented on this section wrote in support of paragraph (c) relating to the cycles for reviews and updates. The FHWA and the FTA note that this paragraph revises and supercedes the April 12, 2005, guidance on "Plan Horizons" allowing MPOs to "revise the metropolitan transportation plan at any time using the procedures in this section without a requirement to extend the horizon year."

A small number of State DOTs and national and regional advocacy organizations that commented on this section said in regard to paragraph (d) that the proposed language limits consultation between State air quality agencies and MPOs in ozone and carbon monoxide (CO) nonattainment and maintenance areas. Transportation control measures (TCMs) can apply to all pollutants so this section should refer to all types of nonattainment and maintenance areas.

Paragraph (d) addresses the MPO's coordination in the development of the TCMs in a SIP in ozone and CO nonattainment areas, pursuant to 49 U.S.C 5303(i)(3). The FHWA and the FTA are clarifying in the final rule the role of the MPO in the development of SIP TCMs, to be more consistent with the statute. Similar coordination is encouraged in the development of SIP TCMs in ozone and CO maintenance areas, as well as particulate matter and nitrogen dioxide nonattainment and maintenance areas. The FHWA and the FTA had proposed additional language
in paragraph (d) that specified that the MPO, State air quality agency and the EPA must concur on the equivalency of any substitute TCM before an existing SIP TCM is replaced under section 176(c)(8) of the Clean Air Act (42 U.S.C. 7506(c)(8)). After consultation with the EPA, this language was deemed unnecessary for the final planning regulations. The EPA has determined that revising the transportation conformity regulations is not necessary to implement the TCM substitution provision in Section 6011(d) of the SAFETEA-LU. The EPA believes that the new Clean Air Act provision contains sufficient detail to allow the provision to be implemented without further regulation. The EPA, the FHWA, and the FTA issued joint guidance on February 14, 2006, that describes how TCM substitutions can occur under the statute. ${ }^{14}$
A small number of State DOTs and a few MPOs and COGs that commented on this section said in regards to paragraph (e) that the requirement for "agreement" is too stringent. The FHWA and the FTA find that a "cooperative" planning process requires agreement among the major planning partners on what assumptions to adopt and what data and analyses to employ to forecast future travel demand. If a State or transit operator conducts a major planning study within the MPO planning boundaries, it is critical that the assumptions and data used in that planning study be considered valid by other planning partners and be consistent with data the MPO will employ to develop its travel models or otherwise develop growth projections in population, employment, land use, and other key factors that affect future travel demand. Both consultation and agreement on those assumptions/data are crucial to this process. However, the FHWA and the FTA also understand that the proposed text may be considered overly restrictive. We eliminated the phrase "the transportation plan update process shall include a mechanism for ensuring that * * * agree * * *"’ and replaced it with "the MPO, the State(s), and the public transportation operator(s) shall validate * * *" The FHWA and the FTA believe that the requirement "validate data" provides more flexibility than "including a mechanism."

[^2]improvement program (STIP), § 450.322 (Development and content of the metropolitan transportation plan), and $\S 450.324$ (Development and content of the transportation improvement program). These key features are: (1) Treatment of highway and transit operations and maintenance costs and revenues; (2) use of "year of expenditure dollars" in developing cost and revenue estimates; and (3) use of "cost ranges/ cost bands" in the outer years of the metropolitan transportation plan.
Regarding the treatment of highway and transit operations and maintenance costs and revenues, the FHWA and the FTA realize that the 1993 planning rule and the NPRM interchangeably referred to the transportation system as either "existing," "total," or "entire."
Several State DOTs, MPOs and COGs, national and regional advocacy organizations, and others expressed concern and confusion over these terms Many commenters called into question the statutory authority for the FHWA and the FTA to focus on State and local government investments to operate and maintain the "system" as part of fiscal constraint and financial plans supporting transportation plans and programs. However, the statute, as amended by the SAFETEA-LU (23 U.S.C. $134(\mathrm{i})(2)(\mathrm{C})$ and 49 U.S.C. 5303(i)(2)(C)), requires that the financial element of a metropolitan transportation plan "demonstrates how the adopted transportation plan can be implemented" and "indicates resources from public and private sources" that can be "reasonably anticipated to implement the plan." A metropolitan transportation plan, as it is developed, must include consideration and recognition of how all the pieces of the regional transportation system will integrate, function and operate, not just those facilities which are or could be funded with Federal resources. To focus solely on the Federally-funded portion of the transportation system could create greater demands on limited Federal resources or jeopardize the value of the Federal investments made within that metropolitan area.
Furthermore, outside the transportation planning process, there is a longstanding Federal requirement that States properly maintain, or cause to be maintained, any projects constructed under the Federal-aid Highway Program (23 U.S.C. 116).
Additionally, the FHWA and the FTA believe that the fundamental premise behind the wording in the October 28, 1993 planning rule regarding highway and transit operations and maintenance (58 FR 58040) remains sound.

However, for purposes of clarity and consistency, § 450.216(n), $\S 450.322(\mathrm{f})(10)$, and § 450.324(i) have been revised to better describe "the system" as Federal-aid highways (as defined by 23 U.S.C. 101(a)(5)) and public transportation (as defined by title 49 U.S.C. Chapter 53). As background, 23 U.S.C. 101(a)(5) defines "Federal-aid highways" as "a highway eligible for assistance other than a highway classified as a local road or rural minor collector." Additionally, these sections clarify that the financial plans supporting the metropolitan transportation plan and TIP and the financial information supporting the STIP are to be based on systems-level estimates of costs and revenue sources reasonably expected to be available to adequately operate and maintain Federal-aid highways (as defined by 23 U.S.C. 101(a)(5)) and public transportation (as defined by title 49 U.S.C. Chapter 53).

Regarding the use of "year of expenditure dollars"' in developing cost and revenue estimates, the FHWA and the FTA jointly issued "Interim FHWA/ FTA Guidance on Fiscal Constraint for STIPs, TIPs, and Metropolitan Plans"' on June 30, 2005. 22 This Interim Guidance indicated that financial forecasts (for costs and revenues) to support the metropolitan transportation plan, TIP, and STIP may: (a) Rely on a "constant dollar" base year or (b) utilize an inflation rate(s) to reflect "year expenditure." The FHWA and the FTA will be developing and issuing revised guidance on fiscal constraint and financial planning for transportation plans and programs soon after this rule is published. In Appendix B, the FHWA and the FTA proposed to exclusively require the use of "year of expenditure dollars" to better reflect the time-based value of money. This is particularly crucial for large-scale projects with construction/implementation dates stretching into the future. Because the transportation planning process serves as the beginning point of the larger "project continuum" (i.e., moving from concept through construction, and later operations and maintenance), the FHWA and the FTA strongly believe that early disclosure of revenue and cost estimates reflecting time and inflation provides a truer set of expectations and future "reality" to the public. However, most of the State DOTs, a few of the national and regional advocacy

[^3]organizations and some MPOs and COGs, commented that they should not be required to use "year of expenditure dollars."

The FHWA and the FTA considered these comments and included in $\S 450.216(\mathrm{~h}), \S 450.322(\mathrm{f})(10)$, and $\S 450.324(\mathrm{~d})$ that "year of expenditure dollars" shall be used "to the extent practicable." While this language expresses the desire of the FHWA and the FTA for revenue and cost estimates to be reflected in "year of expenditure dollars," an opportunity to use "constant dollars" has been retained.
Regarding the use of "cost ranges/cost bands" in the outer years of the metropolitan transportation plan, the FHWA and the FTA jointly issued "Interim Guidance on Fiscal Constraint for STIPs, TIPs, and Metropolitan Plans" on June 30, 2005. The FHWA and the FTA will be developing and issuing revised guidance on fiscal constraint and financial planning for transportation plans and programs soon after this rule is published. The Interim Guidance indicated that for the outer years of the metropolitan transportation plan (i.e., beyond the first 10 years), the financial plan may reflect aggregate cost ranges/cost bands, as long as the future funding source(s) is reasonably expected to be available to support the projected cost ranges/cost bands. In the NPRM, the FHWA and the FTA proposed to provide this option to MPOs in developing fiscally-constrained metropolitan transportation plans. We have included this option in this rule because we believe it gives MPOs maximum flexibility to broadly define a large-scale transportation issue or problem to be addressed in the future that does not predispose a NEPA decision, while, at the same time, calling for the definition of a future funding source(s) that encompasses the planning-level "cost range/cost band."

## 23 CFR Part 500

## Section 500.109 Congestion

## Management Systems

Few docket documents specifically referenced this section. However, the docket included more than 25 documents that contained almost 30 comments on § 450.320 (Congestion management process in transportation management areas) which is relevant to this section.

As was mentioned, on May 16, 2006, the U.S. Secretary of Transportation announced a national initiative to address congestion related to highway, freight and aviation. The intent of the "National Strategy to Reduce Congestion on America's Transportation

Network" is to provide a blueprint for Federal, State and local officials to tackle congestion. The States and MPO(s) are encouraged to seek Urban Partnership Agreements with a handful of communities willing to demonstrate new congestion relief strategies and encourages States to pass legislation giving the private sector a broader opportunity to invest in transportation. It calls for more widespread deployment of new operational technologies and practices that end traffic tie ups, designates new interstate "corridors of the future," targets port and border congestion, and expands aviation capacity.
U.S. DOT encourages the State DOTs and MPOs to consider and implement strategies, specifically related to highway and transit operations and expansion, freight, transportation pricing, other vehicle-based charges techniques, etc. The mechanism that the State DOTs and MPOs employ to explore these strategies is within their discretion. The U.S. DOT will focus its resources, funding, staff and technology to cut traffic jams and relieve freight bottlenecks.

A few comments were received reiterating that the CMP should result in multimodal system performance measures and strategies. The FHWA and the FTA note that existing language reflects the multimodal nature of the CMP. Specifically, § 450.320(a)(2) allows for the appropriate performance measures for the CMP to be determined cooperatively by the State(s), affected MPO(s), and local officials in consultation with the operators of major modes of transportation in the coverage area.

Several commenters asked for a clarification with regards to what CMP requirements apply in air quality attainment areas, as opposed to the requirements in air quality nonattainment areas. The CMP requirements for all TMA areas (attainment and nonattainment) are identified in $\S \S 450.320(\mathrm{a}), 450.320$ (b), 450.320(c), and 450.320(f). Additional CMP requirements that apply only to nonattainment TMA areas (for CO and ozone) are identified in $\S 450.320$ (d) and §450.320(e).

## 49 CFR Part 613

The NPRM proposed to simplify FTA's cross-reference in 49 CFR Part 613 to 23 CFR Part 450. Because there may be references to the three subparts in 49 CFR Part 613 in various other regulatory and guidance documents, FTA has made technical changes to what was proposed in the NPRM to retain the names of the subparts in this part the same as they were prior to this rule. This will reduce confusion by keeping the names of the subparts the same, but still allowing for the crossreference simplification and alignment of identical regulatory requirements that FTA had proposed.

## Distribution Tables

The NPRM proposed to clarify and revise the regulation's section headings to use plainer language. These changes have been made. For ease of reference, two distribution tables are provided for the current sections and the proposed sections as follows. The first distribution table indicates changes in section numbering and titles. The second provides details within each section.

## Section Title and Number

| Old section | New section |
| :---: | :---: |
| Subpart A | Subpart A |
| 450.100 Purpose | 450.100 Purpose. |
| 450.102 Applicability | 450.102 Applicability. |
| 450.104 Definitions | 450.104 Definitions. |
| Subpart B | Subpart B |
| 450.200 Purpose | 450.200 Purpose. |
| 450.202 Applicability | 450.202 Applicability. |
| 450.204 Definitions | 450.204 Definitions. |
| 450.206 Statewide transportation planning process: General require- ments. | 450.206 Scope of the statewide transportation planning process. |
| 450.208 Statewide transportation planning process: Factors | 450.208 Coordination of planning process activities. |
| 450.210 Coordination | 450.210 Interested parties, public involvement, and consultation. 450.212 Transportation planning studies and project development. |
| 450.212 Public involvement | 450.214 Development and content of the long-range statewide transportation plan. |
| 450.214 Statewide transportation plan | 450.216 Development and content of the statewide transportation improvement program (STIP). |
| 450.216 Statewide transportation ................................................... | 450.218 Self-certifications, Federal improvement program (STIP). findings, and Federal approvals. |
| 450.218 Funding | 450.220 Project selection from the STIP. |
| 450.220 Approvals | 450.222 Applicability of NEPA to statewide transportation plans and programs. |
| 450.222 Project selection for implementation $\qquad$ <br> Subpart C | 450.224 Phase-in of new requirements. <br> Subpart C |
| 450.300 Purpose | 450.300 Purpose. |
| 450.302 Applicability .................................................................... | 450.302 Applicability. |
| 450.304 Definitions | 450.304 Definitions. |
| 450.306 Metropolitan planning organizations: Designation and redesignation. | 450.306 Scope of the metropolitan transportation planning process. |
| 450.308 Metropolitan planning organization: Metropolitan planning boundary. | 450.308 Funding for transportation planning and unified planning work programs. |
| 450.310 Metropolitan planning organization: planning agreements ...... | 450.310 Metropolitan planning organization designation and redesignation. |
| 450.312 Metropolitan transportation planning: Responsibilities, cooperation, and coordination. | 450.312 Metropolitan planning area boundaries. |
| 450.314 Metropolitan transportation planning process: Unified planning work programs. | 450.314 Metropolitan planning agreements. |
